Emphasizing the importance of filters Filters can be applied to all the layers in a Photoshop image, so if you're playing around with a project, you can apply a filter to one layer that changes the appearance of the entire image. On the other hand, you can apply a filter to only one layer to emphasize a particular element of the image. One of the most common ways to do that is to use a filter with a different color range to accent an element in a picture. For example, if you have an image that has too many gray areas or spots that detract from the picture, you can use a black-and-white filter to make the image look a little cleaner. No matter how you use the filter, your goal is the same: To tell Photoshop to

Multi loci analysis of genetic variation for 136 markers in the chicken. Here, we report a multi loci analysis of genetic variation for 136 markers that was performed with a set of unrelated chickens for DNA fingerprinting. Using mixed sire families, we identified 7 polymorphic markers for the 27 analyzed chromosomes. The average heterozygosity was about the same for each chromosome. The number of haplotypes exceeded the number of alleles. We compared the level of genetic variation obtained with these data with those obtained with other chicken sets. Our data suggest that there was no excess of homozygotes. All markers were polymorphic in at least one population. The polymorphism decreased with an increase in the heterozygosity per marker locus and with an increase in the distance to the centromere. The rate of recombination was estimated to be on the order of 3×10^{-4} per marker interval. These data, in addition to the existence of haplotypes and the presence of multiple short chromosomes, indicate a limited level of recombination around the centromere. A comparison of genetic variation in the MHC region suggests that the strong decrease of genetic variation around the centromere is because of linkage. Digital radiography (DR) systems are commonly used to obtain digital images of the chests of patients during chest examinations. During such examinations, it is sometimes desirable to be able to zoom in on a body part of the patient to view it in more detail, or to move closer to the chest wall in order to reduce the image noise. There are several known methods for zooming in or out on an image of a body part. To zoom out, a single (or multiple) image frame is extracted from the image sequence and displayed with reduced resolution. To zoom in, either a single (or multiple) image frame is extracted from the image sequence and displayed with increased resolution, or a subset of frames are extracted from the image sequence, each image frame of the subset being displayed with increased resolution, and the consecutive frames being shown for a fraction of the time, the sequence being repeated when the displayed frames are complete. Examples of such methods are described in U.S. Pat. No. 5,729,632 and U.S. Pat. No. 6,327,703. However, these known methods have several disadvantages. While these known methods work well for zooming out, they are not capable of resizing and panning in the same way that a person would move to view a portion of a printed page, for example, on a computer screen. When a person views a portion of a printed page on the computer screen, the portion is visible to the person and can therefore be viewed by eye without moving the page. This does not apply, however, in the case of a digital image, in which case only a portion of the image can be rendered visible on the computer screen due to the reduced resolution. In addition, when zooming in on a portion of an image to view the image in more detail, there is a risk that this operation will involve scrolling of the computer screen, so that the portion of the image to be viewed in more detail is not visible to the user. This is also not possible when zooming out on an image to reduce the image noise. An object of the present invention is to provide a method for conveniently obtaining a digital image comprising a body part of a patient at a desired zoom level and/or at a desired orientation.
