The treatment of chronic recurrent tonsillitis by tonsillectomy is well known. It is a widely accepted method, but this technique does not seem to be particularly effective in the treatment of chronic recurrent phlegmonous pyoderma. The aim of this study was to evaluate the changes in the "pathogenic role" of tonsils in the etiology of chronic recurrent pyoderma and the effectiveness of the surgical treatment of tonsils and tonsil tissues in the patients with this disease. The study was performed on 74 patients operated for chronic recurrent pyoderma in the Department of Otorhinolaryngology, Kazan Medical University, during the period from 1976 to 1992. All the patients were divided into two groups. In the first group 18 patients were operated with tonsillectomy and the rest of the patients were operated with external drainage of pyosis and excision of tonsillar tissues. The observations demonstrated a greater effectiveness of the first technique. The authors recommend this surgical treatment in acute and subacute forms of the disease. Description Penny Arcade has been bringing gamers, comics, and a million other activities into one package since 1995, in order to make video games feel more like real life, even if we're all just trapped inside a machine. Even in the most well regarded titles, the conversations have helped inject fun and charm into gameplay, bringing in everything from questions about game mechanics to quips about the way the world is. With Penny Arcade, you can get information on all the new releases as well as the old classics. This lets you know if it's a must-have or a disappointingly bad title, and it also helps you negotiate what games to go for when everyone is talking about something else. So when you want to play video games, come to Penny Arcade! This invention relates to the formation of a multi-layered protective polymer film for containing and protecting a pressure sensitive adhesive (PSA) tape which is used to protect and secure various articles. More specifically, this invention relates to the formation of a multi-layered polymer film used to contain a PSA tape for protecting and securing various articles to a surface, to which it is to be applied. Various materials are known to be applied to a surface, where they are released from the

Nitric oxide synthase (NOS) catalyzes the conversion of the amino acid L-arginine to L-citrulline and the gas nitric oxide (NO). All three NOS isoforms, NOS1, NOS2, and NOS3, represent important targets for pharmacotherapy of cardiovascular and neurodegenerative diseases. Although the three isoforms show high similarity in structure and chemistry, the important differences in pharmacology, enzymatic characteristics, and inducibility have led to a lack of selective drugs for the individual NOS isoforms. This can be attributed to the fact that NOS shares the same reaction mechanism but differs in binding affinity for the cofactors and substrate of the different NOS isoforms. Significant effort has been invested in finding NOS selective drugs, but the results have been disappointing. Here, the coupling of NOS with cofactors and substrate at the level of the X-ray crystal structures is exploited to investigate the structural basis of the ligand-selectivity in each of the three NOS isoforms. Computational investigations of the binding modes of 15 known NOS active-site ligands were performed, revealing conformational differences in the ligand pocket with different ligand families.
