AutoCAD operates in two modes, one of which allows the user to drag 2D or 3D objects around and modify their appearance. The second mode allows the user to move, copy, rotate, and resize 2D objects. The Draw (2D or 3D) mode provides the user with many commands to draw, modify, copy, and paste 2D or 3D objects. In addition, there are commands to configure the toolbars, including creating or modifying menu commands, and to use objects, blocks, and features. The commands available in the Drawing mode include: Display of menu commands, icons, and toolbars, depending on the drawing type. Viewing and editing layers, toolbars, and menu commands. Editing data fields, including coordinate systems and unit system. Editing block properties, including the appearance of hidden parts of the object and visibility of blocks and their parts. Drawing, moving, copying, and pasting 2D objects. Changing the placement of the object by moving or resizing it. Drawing and modifying the elements of 3D objects. Moving and rotating objects. Displaying blocks and their properties. Copying, moving, and deleting blocks. Checking object status, including changes made to blocks and 3D elements. Importing or exporting data, including blocks and 3D elements. Grading and dimensioning objects. Adding and editing text and graphics. Adding 2D or 3D comments, showing or hiding blocks. Changing the display mode and view. Printing. The Drawing Toolbar provides tools to help manage drawing functions, including an eraser, line color picker, line style picker, and measure tool. The command list also includes an option to hide the toolbar. The toolbar can be placed on the screen or displayed as a tab in the side toolbar or the main toolbar. Also available in the Drawing Toolbar is a ruler. The Toolbar allows the user to configure toolbars or temporarily show and hide the toolbars. The command list also includes an option to hide the toolbar. The 3D tools include tools for viewing, rotating, or placing and modifying 3D objects. The 3D tools include: Tool view. Three views: Perspective view. A perspective view is a front view in which the 3D model appears as a two-dimensional drawing. This type of view is useful for creating graphics for a 2D presentation, such as a map or blueprint, or for printing or creating a 2D picture
