I have created an udf. and in that I am using an external variable and that is returning an error in this line: select * from table1 where column1 in (select distinct column2 from table1 where column1 = @col1 for XML path(")) but when I replace that select distinct with select @col1 it gives an error that variable '@col1' is undefined. Could you please tell me how to use external variable in a UDF? A: SQL Server requires the use of local variables to implement user defined functions. The internal code to a user defined function is hidden from the compiler, but the external code can be seen and you can read through the decompiled version of it. The SQL Server compiler does not recognize UDFs or user defined functions. It does not recognize the variable part of the code since it is seen as part of the function. SQL Server throws 595f342e71
