There are also many helpful free Photoshop resources available. The Adobe Photoshop Users Group (www.photoshopusers.com) has free online tutorials, including screencasts of the most useful features of the program, for beginners, as well as long and in-depth tutorials for advanced users. Photoshop Elements As a free alternative to Photoshop, Adobe offers what it calls Photoshop Elements. Elements can be used to edit raster images such as photographs and vector graphics, as well as vector-based content including illustration. It includes many of the same basic features as Photoshop, including the layer-based editing system, adjustment layers, and content-aware technologies, such as red-eye reduction, yet it's easier to use for beginners. ImageMagick Probably the most popular image editing software for macs is ImageMagick. Many users can generate, convert, and manipulate images within Adobe programs, but it also has a command-line utility, written in C++, that can be very useful for those who need the convenience of a shell interface for image work. Many people use it to strip EXIF information from jpeg images, remove the region that the user clicked on in an image, or combine multiple images in one. It also has many useful image transformations like rotating, resizing, and cropping. ConvertX for Mac ConvertX for Mac is similar in functionality to ImageMagick, but it's command-line only. It's a great tool for the complete beginner, and I give an example of using it in Figure 6-1. Illustrator Illustrator, like Photoshop, is a vector image editor that can be used for both raster and vector images. Like Photoshop, Illustrator is used by professionals in the industries of print design, graphic design, and web design. Illustrator features a powerful selection tool, many useful drawing tools, a text tool with different writing styles, and a brush tool with 20,000 available brush presets. **Figure 6-1:** ConvertX is a Mac shell utility that can perform numerous image editing tasks. Drawing tools Illustrator has many drawing tools. It has an elliptical compass, and an arc compass. It also has line, circle, ellipse, bezier, polyline, and rectangular selection tools. Drawing objects in Illustrator is not much different from using a tool in another graphic editing program like Photoshop. Figure 6

Photoshop is the world's most popular graphics software and an essential tool for all image editing and designing needs. It is used for everything - from photographing, graphic designing to web designing - as an image editor and an app for image editing, graphic designing, image masking and gif creation. However, a Photoshop license is a hefty investment and, because of the high learning curve of the software, many newcomers leave the software after investing a great deal of time and money on learning. This is because Photoshop is like a Swiss Army Knife; it is a must have for every toolbox, but it is far from the sharpest knife out there. Q: Change a table row conditionally with jquery I have a table like this: example 1 example 2 example 3 nope nope nope How can I change the row conditionally based on an ajax call? So for example if an ajax call returns some data it will change the tr#row1 to: new data new data new data Which will then replace the old row with the updated one. I was thinking of using jquery.each loop maybe and just keep changing id="row1" to id="row2". But I don't know how to apply this to an already generated table. Something like: \$('#table').html(...); \$('#row1').each(function(){ if(additional data){ \$(this).attr('id','row2'); } ... } A: if you are talking about replacing the entire table row, you can use the.replaceWith() jQuery method: \$('#table').html(...).replaceWith('#row2'); If you just want to replace a single cell, you can use.html(): \$('#row1 td').html('row 2'); A: Use the index. Something like this. (Note that there is an additional tr added for the first row, so that each iteration matches the previous row.)

Atypical B-cell proliferation in the lymph node of a patient with angioimmunoblastic T-cell lymphoma. Atypical B-cell proliferation of angioimmunoblastic T-cell lymphoma (AITL) was observed in a peripheral lymph node of a patient with AITL. In a subsequent biopsy of an inguinal lymph node in the patient, a less differentiated type of malignant lymphoma was diagnosed. We report this rare case of AITL with atypical B-cell proliferation in a patient with long-term survival. Computer screens have long been used to display visual information to a viewer. In particular, cathode ray tube (CRT) displays have been in widespread use as the typical computer display device. In most cases, the CRT is disposed within the computer monitor. The majority of computer monitors, including CRTs, are made of a glass or plastic material. The CRT and other computer monitor components are sealed within a housing made of a material that is similar to the display material. Since CRTs are expensive, difficult to manufacture and generate a significant amount of heat, there is a tendency to use as little of the CRT as possible within the housing of the computer monitor. However, compactness of the computer monitor is often important. There are many conventional ways to mount computer monitors such that the monitors can be lifted out of, and replaced in, the display housing. U.S. Pat. No. 5,551,027 discloses a slidable monitor section that receives a computer monitor. Other methods involve coupling a monitor to a movable pedestal. However, in each of these designs, the monitor is mounted within the housing of the computer monitor. One of the problems associated with a conventional monitor mounted within the housing is that the housing may block access to the monitor. In many instances, a printed circuit board, cables, the monitor and other monitor components are housed within the housing. For example, many monitors employ a horizontal printed circuit board between the back of the monitor and the front cover. This printed circuit board may contain, among other things, a horizontal cable used to provide and monitor power to the monitor and a vertical cable used to provide a video signal to the monitor. The cables must be connected to the printed circuit board and to electrical components inside the monitor. It may be difficult or impossible to access the printed circuit board or the cables within the housing. In most prior computer monitors, the monitor is only
