The source is from a third party that could be modified. The source of the feed is directly linked to it. Q: Allocating memory for allocating memory? Is there a name for a situation where a variable is used to allocate memory for itself? For example: `char* a = malloc(sizeof(char*)); char* b = malloc(sizeof(char*)); *a = *b;` Can the above code be optimised to the following? `char a[1]; char b[1]; *a = *b;` A: In your scenario the obvious name would be undefined behavior. For your example the variable b is no longer a pointer. Try `(*a) = b;` and this will only work for arrays of size 1. A: It's not a very good example. A more real-world example would be: `typedef struct element* Element; int i; Element *a = malloc(sizeof(Element)); Element *b = malloc(sizeof(Element)); *a = *b; a->data = b->data;` If you read this as, "I've got two struct elements, so I allocate memory for struct elements", then you can't do what you want. It is perfectly fine to write: `Element *a = malloc(sizeof(Element[2]));` Or: `Element a[2];` If you read it as, "Here's a bunch of struct elements", then you can use it, no problem. A: The reason this code is legal is that C implicitly promotes malloc-ed variables to pointers. So in your example: a is promoted to a pointer to a char, so it has type `char (*)[1]`; b is promoted to a pointer to a char, so it has type `char *`; the second declaration dereferences the pointer and casts it to char, and then assigns the value. Thus your first example can be optimized by

I've had a lot of fun working on this album over the past few months. Some of you will recognise
a few tunes from the album that I've played many a time throughout the past two years. The
recording quality isn't the best I'm afraid (and I am still on a budget) but I think you'll recognise
a couple of our favourites nonetheless. lindalegsonshow legsonshowlindabareham Â· login error
